# 1 Modifying Routing to Avoid Fragmentation

We learned in class that in order to avoid fragmentation, IP tries various packet sizes till it finds one that works. Alternately, we could modify the routing protocol to compute the minimum of the maximum packet sizes of all links on the best route to each destination. In distance vector routing, a router R computes its own distance, Distance(P, R) to a destination prefix P using the distances sent by its neighbors as follows: Distance(P, R) = Minimum across all neighbors N of Distance(P, N) + Distance(R, N). We want to see how to modify this protocol to also compute the minimum max packet size on the shortest distance route to P.

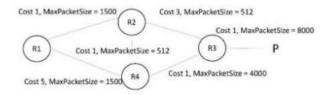

Figure 1: Router topology

(a) In Figure 1, what is the shortest path between R1 and P? What is the largest packet size that is guaranteed to get through without fragmentation on this path?

#### Solution:

The shortest path is [R1, R2, R4, R3, P], which has a cost of 4. The largest packet size that is guaranteed to get through without fragmentation on this path is 512, enforced by the link between R2 and R4.

(b) Assume each router R has received the variables Distance(P, N) and MinMaxPacketSize(P, N) from each neighbor N. Write an equation to compute Distance(P, R) and MinMaxPacketSize(P, R) from the corresponding variables obtained from all of R's neighbors.

#### Solution:

Note: MMPS = MinMaxPacketSize and MPS = MaxPacketSize

Distance(P, R) = Minimum across all neighbors N of <math>Distance(P, N) + Distance(R, N)

 $MMPS(P,R) = \min(MMPS(P,N), MPS(R,N))$  of the N that minimizes Distance(P,R)

# 1 Modifying Routing to Avoid Fragmentation

We learned in class that in order to avoid fragmentation, IP tries various packet sizes till it finds one that works. Alternately, we could modify the routing protocol to compute the minimum of the maximum packet sizes of all links on the best route to each destination. In distance vector routing, a router R computes its own distance, Distance(P, R) to a destination prefix P using the distances sent by its neighbors as follows: Distance(P, R) = Minimum across all neighbors N of Distance(P, N) + Distance(R, N). We want to see how to modify this protocol to also compute the minimum max packet size on the shortest distance route to P.

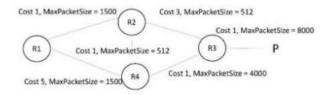

Figure 1: Router topology

(a) In Figure 1, what is the shortest path between R1 and P? What is the largest packet size that is guaranteed to get through without fragmentation on this path?

#### Solution:

The shortest path is [R1, R2, R4, R3, P], which has a cost of 4. The largest packet size that is guaranteed to get through without fragmentation on this path is 512, enforced by the link between R2 and R4.

(b) Assume each router R has received the variables Distance(P, N) and MinMaxPacketSize(P, N) from each neighbor N. Write an equation to compute Distance(P, R) and MinMaxPacketSize(P, R) from the corresponding variables obtained from all of R's neighbors.

#### Solution:

Note: MMPS = MinMaxPacketSize and MPS = MaxPacketSize

Distance(P, R) = Minimum across all neighbors N of <math>Distance(P, N) + Distance(R, N)

 $MMPS(P,R) = \min(MMPS(P,N), MPS(R,N))$  of the N that minimizes Distance(P,R)

+ O pts Empty

(c) Assume we are calculating these estimates only for distances to P. Assume that at t=0, router R3 has Distance(P,R3)=1 and MinMaxPacketSize(P,R3)=8000 and all other routers have the distance and min packet size to P set to a default of infinity. Assume that at t=0 each router sends an update to each neighbor. Note that t=1 means each router has sent one update to each of its neighbors (i.e. one transmission takes one unit of time). Draw several pictures of the same topology with the changing estimates of each router for its two variables based on the equation you wrote down until all estimates stop changing. After how much time do all the estimates converge (i.e., do not change any more)?

#### Solution:

The estimates converge at t = 3.

√ + 1 pts Attempted

+ O pts Empty

(d) Now assume the link from R2 to R4 crashes say at time t=7. Draw similar pictures for the time it takes to converge after the crash.

# Solution:

Assuming R2 and R4 detect the failure and correct their routes at t=7, the estimates will then reconverge at t=8.

# 2 Link State Routing and Crashes

Consider the topology shown in Figure 2. This is the same topology we used in the slides to show the count up phenomenon for distance vector when both the links from R4 to R2, and the link from R4 to R3 went down using distance vector. We want to see why the count up phenomenon does not happen with link state.

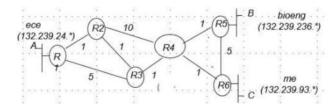

Figure 2: Router topology

(a) Draw the link state packets sent by R4, R5 and R6 before any link crashes.

#### Solution:

R4:	R4	R5:	R5	<i>R</i> 6:	R6
	LSP		LSP		LSP
	R2, 10 $R3, 1$		R4, 1		R4, 1
	R5, 1		R6, 5		R5, 5
	R6, 1		bioeng, 1		me, 1

(b) Draw the link state packet sent by R4 after the links from R4 to R2 and from R4 to R3 crash (R5 and R6 stay the same).

#### Solution:

R4						
LSP						
R5, 1						
R6, 1

R6, 1						

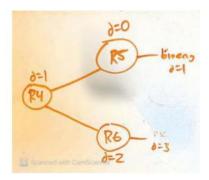

# 2.2 2b 4/4

- √ + 4 pts Correct
  - + 3 pts Minor mistakes
  - + 2 pts Attempted
  - + 2 pts Late submission
  - + **0 pts** Empty

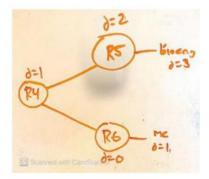

(c) Assume this new LSP from R4 gets to R5 and R6 in a few msec. Show the Dijkstra tree at R5 and R6 and explain why after R5 finishes its Dijkstra calculations (say a few msec), it will conclude that ece is unreachable even though it still has link state packets from R1, R2, and R3, and R2 and R3's old link state packets are wrong!

#### Solution:

R5:

R6:

R5 and R6 will conclude that ece is unreachable because, when using Dijkstra's to compute a route, each router only looks at the LSPs of routers within the permanent set. Once R4 ends up in the permanent set, its new LSP will be used. This new LSP does not indicate that R2 or R3 are neighbors, so they will never enter the tentative set. Since they never enter the tentative set, they can never enter the permanent set. As a result, despite having out-of-date LSPs for R1, R2, and R3, they will never be considered by R5 or R6's route computation algorithms, as they are never introduced into the tentative or permanent sets.
